Google Docs vs. Doxygen

When I started at work, I was confused about when to use Google Docs versus Doxygen. Here is the simple breakdown of what I learned!

What is Google Docs?

Google Docs is an easy-to-use online word processor. It works just like a regular typing app, but everyone on the team can edit together in real time, type notes, and share visual reports.

What is Doxygen?

Doxygen is a tool for programmers. Instead of typing a manual by hand, developers write comments directly inside their computer code, and Doxygen automatically turns those comments into neat technical documentation.

Quick Summary

- **Use Google Docs** for brainstorming, project proposals, team meeting notes, and general reports.
- **Use Doxygen** when you are writing software code and need to auto-generate technical code reference guides.
